Common Exam 2
8:30-9:45 am Friday, Oct. 30th (Arrive by 8:15 am)
TIER 116 (Tiernan Lecture Hall 1)
Bring calculators
B1: Chap 4, B2: Ch.6, Up to “Other Application of Newton’s Laws”

To combat cheating, while taking the exams
1) students must show their ID upon entering the classroom,
2) no cell phone use,
3) if a student leaves the room during test time, e.g. Men’s/Ladies’ room,
he/she forfeits finishing the exam.

Formula sheet, sample problems and old exams: Check course web.

Review session: Oct. 29 Thursday class

HW #8: Appl. Of Newton’s Laws (Due 1pm central time, Oct. 26, Monday)

Last Class...

Uniform Circular Motion
Non-uniform circular Motion

Today...

Other Application of Newton’s Laws (B.2, Ch.6, S.3-4)
Example: Multiple objects moving together.

\[ m_2 = 6 \text{ kg} \quad m_1 = 4 \text{ kg} \]

\[ F = 20 \text{ N} \]

Frictionless surface

iClicker: Find the acceleration.

(a) 5 m/s^2
(b) 2 m/s^2
(c) 10 m/s^2
(d) 20 m/s^2
(e) \( \frac{20}{6} \) m/s^2

Example: Find the tension in the rope between the two blocks.

Example: Two objects moving together

\[ m = 4.26 \text{ kg} \]

A block of mass 4.26 kg lies on a frictionless horizontal surface. The block is connected by a cord passing over a pulley to another block of mass 2.16 kg which hangs in the air, as shown on the following picture. Assume the cord to be light (massless and weightless) and unstretchable and the pulley to have no friction and no rotational inertia.

The acceleration of gravity is 9.8 m/s^2.

Calculate the acceleration of the first block. Answer in units of m/s^2.

Calculate the tension in the cord. Answer in units of N.
Example

Curved portions of highways are always banked (tilted) to prevent cars from sliding off the highway. When a highway is dry, the frictional force between the tires and the road surface may be enough to prevent sliding. When the highway is wet, however, the frictional force may be negligible, and banking is then essential. Figure represents a car of mass $m$ as it moves at a constant speed $v$ of 20 m/s around a banked circular track of radius $R = 190$ m. If the frictional force from the track is negligible, what bank angle $\theta$ prevents sliding?
A 1.67 kg block is placed on top of a 0.03 kg block. The coefficient of kinetic friction between the 6.03 kg block and the surface is 0.28. A horizontal force \( F \) is applied to the 6.03 kg block.

The acceleration of gravity is 9.8 m/s\(^2\).

Two blocks moving together → Treat like one big block

Focus on upper block.

Net force on it should be the static friction.

Find the minimum coefficient of static friction \( \mu_b \) between the blocks such that the 1.67 kg block does not slip under an acceleration of 3.69 m/s\(^2\).
