• Three Common Exams: 45%
  (15% each)
• Quizzes: 7%
• Homework: 8%
• Workshop: 10%
• Final exam: 30%

A 80+
B+ 75-79
B 70-74
C+ 65-69
C 55-64
D 50-54
F < 50

Evaluations for all courses will be conducted online.

The Course Evaluation site will be active from 9 am Monday, November 9th until midnight of Thursday December 10th.

The URL address: http://www.njit.edu/courseevaluation

Students will use their NJIT UCID and UCID password (same as “Highlander Pipeline”) to login and go to a landing page which will have all their courses listed.

All those who participate in the Online Course Evaluation will have a chance to win an Apple iPod Touch 8 G.
Work and Energy for Exam 3

“Impulse” and “Momentum” till final exam.

Today...

Definition of impulse
Definition of momentum
Impulse-Momentum Theorem

Data: Fatality of a driver in head-on collision

(With a passenger) < (Without a passenger)
Definition of Impulse

Impulse: \( \vec{I} \equiv \vec{F} \times \Delta t \)  
F : force, \( \Delta t \) : time

\( \Rightarrow \) A vector quantity
\( \Rightarrow \) SI Unit: N \( s \)

Definition of (Linear) Momentum

(Linear) Momentum \( \vec{p} = m \vec{v} \)  
(\( m \): mass, \( v \): velocity)

\( \Rightarrow \) A vector quantity
\( \Rightarrow \) SI Unit: kg \( m/s \)
Impulse-Momentum Theorem

Let's rewrite Newton's Second Law

\[ \vec{F}_{net} = m \ddot{a} = m \frac{\vec{v}_f - \vec{v}_i}{\Delta t} = \frac{m \vec{v}_f - m \vec{v}_i}{\Delta t} = \frac{\Delta \vec{p}}{\Delta t} \]

\[ \vec{F}_{net} \Delta t = \Delta \vec{p} \]

\[ \vec{I}_{net} = \vec{p}_f - \vec{p}_i \]

Net impulse is equal to the change in momentum

Impulse by a constant force

\[ I = F \Delta t \]

(Area in F vs. t graph) = (Impulse by F)
Impulse by a varying force

Impulse is an area under $F(t)$ graph!

$\vec{p}_i$

$\vec{p}_f$

$F_{\text{net, average}} \times \Delta t = \vec{I}_{\text{net}} = \Delta \vec{p}$

iClicker Quiz

A paratrooper whose chute fails to open lands in snow; he is hurt slightly. Had he landed on bare ground, the stopping time would have been 10 times shorter and the collision lethal. Does the presence of the snow (a) increase, (b) decrease, or (c) leave unchanged the values of

(1) the paratrooper's change in momentum,
(2) the impulse stopping the paratrooper, and
(3) the force stopping the paratrooper?
Example 2

A 0.150 kg baseball, thrown with a speed of 40 m/s, is hit straight back at the pitcher with a speed of 50 m/s.

(a) What is the impulse delivered by the bat to the baseball?

(b) Find the magnitude of the average force exerted by the bat on the ball if the two are in contact for $2.0 \times 10^{-3}$ s.

---

**iClicker Quiz**

A ball with original momentum +4.0 kg·m/s hits a wall and bounces straight back without losing any kinetic energy.

The change in momentum of the ball is:

a. 0.

b. $-4.0$ kg·m/s.

c. 8.0 kg·m/s.

d. $-8.0$ kg·m/s.
