Page Design and Navigation Prototypes

For the webpage design, I have used simple animated pictures and simple design so that user can access it easily. Moreover, making simple webpage helps user to remember path when he/she uses next time. I have “back” and “next” buttons that navigates user where he/she wants to go. Navigation is essential on any page. The navigation prototypes for my show helps to manage with buttons. I tried to make the page as consistent as possible. In addition there is back button which takes to home page. I used simple light color which attracts user because bright color makes hard for user to access.

In addition, hierarchy is very important because it gives broad information about web design, organization planning, and project design. Therefore, I have used hierarchy for this project so that I can manage to design my project as I desired. This hierarchy navigate to make neat web design.
