

Welcome to NJIT !!!

Physics 105

Fall 2009

Instructor:

Prof. Andrei Sirenko

<http://web.njit.edu/~sirenko>

476 Tiernan

Office hours: After the classes M.
 Before classes on R.
 or by appointment
 973-596-5342

- 105 Physics;
 - Course information and Introduction
- Introduction and Measurements
 - (Chapter 1)

Course Elements:

- Textbook
- Lectures
- Recitations
- Homework **Utexas** (class 10519)
- Exams (3 Common QZs, Final Exam)

Do not forget about
the **Lab, WorkShop, Recitations !!!**

Textbook:

NJIT Physics 105 / 106 -- Physics for Scientists and Engineers Enhanced College Physics”
by Serway/Faughn/Jewett/Vuille (Publisher: Thomson)
(Part 1)

***ACP NJIT PHYSICS 105/106**
by SERWAY/JEWETT, A/

ISBN-10: 1-4240-7955-1 (1424079551)
ISBN-13: 978-1-4240-7955-1 (9781424079551)

INSTRUCTIONS to access HOMEWORK on QUEST service of UTexas

Go to <http://cns.utexas.edu/quest/support/student> and follow instructions for off-campus students.

1. Click on first link (<http://www.utexas.edu/eid>) to get your EID and choose your password
2. Go to second link (<http://quest.cns.utexas.edu/student>) and enroll in class (instructor GEORGIOU)

"10519" for section 019

After your enrollment is approved

3. Go back to <http://quest.cns.utexas.edu/student> and you will see all the Homework I assign. Click on the homework number to start to do that assignment.

Lecture 1

Andrei Sirenko, NJIT

7

Lectures and Recitations: (TIER 113 and FMH310)

- Presentation of the concepts and techniques of Physics.
- Demonstrations of Physics in action.
- Lecture quiz at the end of every lecture
- Lectures are not a substitute for reading the text!
Text chapters are listed on the lecture schedule.
Read ahead; you'll get more from lecture.
- Slides will be posted on the course web.
Use these as a study guide/note taking aid.
- Recitations provide an opportunity to do a group activity relevant to the topic being studied, and to ask homework questions.
- The scenarios presented in the recitation group activities will be on the exams.

Lecture 1

Andrei Sirenko, NJIT

8

Grade Components

- **Common Exams 45% total (15% each)**
- **Lecture Quizzes 7%**
- **Homework 8%**
- **Final Exam 30%**
- **Workshop 10%**

A	80-100
B+	75-79
B	70-74
C+	65-69
C	55-64
D	50-54
F	< 50

How to Do Well

- Keep up!
- Do the **homework** carefully and understand the reason for each step.
- Form a study group to discuss homework problems.
- Do plenty of extra problems and examples.
- The material gets more difficult through the term. Don't slack off if you are doing well !

Lectures:

- Presentation of the concepts and techniques of Physics.
- Demonstrations of Physics in action.
- Lecture quiz at the end of every lecture
- **Lectures are not a substitute for reading the textbook!**
 - Text chapters are listed on the lecture schedule.
 - Read ahead; you'll get more from lecture.
- Slides will be posted on the course web.
 - Use these as a study guide/note taking aid.

Recitations

- Recitations provide an opportunity to do a group activity relevant to the topic being studied, and to ask homework questions.
- The scenarios presented in the recitation group activities will be on the exams.

What is Physics?

- **Physics** (n.) - The branch of science that deals with the nature and properties of matter and energy.
- **Mechanics** (n.) - The branch of physics that deals with the motion and equilibrium of material bodies and the action of forces.

Physics is an Experimental Science

Theory (n.)

A system of thoughts or statements explaining something.

Experiment (n.)

An action undertaken to make a discovery or test a hypothesis.

Classical Mechanics

Classical Mechanics is a theory that predicts the results of experiments for objects that are not too:

- Small (Quantum Mechanics)
Atoms and subatomic particles
- Fast (Special Relativity)
Objects moving near the speed of light
- Dense (General Relativity)
Black holes and similar objects; the early Universe

Measurements (HR&W, Chapter 1 Sections 1-6)

The Standard Kilogram

Courtesy Bureau International des Poids et Mesures, France

- Measuring Things
- International System of Units (SI System)
- Conversion of Units
- Length
- Time
- Mass

Measurement and Units

In order to have sensible discussion about experiments, we need to agree on a system of measurement.

This is so important for Science, Engineering, and Commerce that it is done by governments and controlled by international agreements.

Lecture 1

Andrei Sirenko, NJIT

17

Types of Quantities

Many things can be measured:

Position, velocity, energy, time, forces...

These are related to one another

(e.g. velocity = distance / time)

Choose three basic quantities:

LENGTH, MASS, TIME

Define other units in terms of these.

Lecture 1

Andrei Sirenko, NJIT

18

Systems of Units

The Standard Kilogram

Courtesy Bureau International des Poids et Mesures, France

distance XY = 1 quadrant of the Earth

$$1 \text{ meter} = |XY|/10000000$$

Many choices are possible for three basic units of **LENGTH, MASS, TIME**:

Metric (SI, *Système Internationale*) **since 1971**
meter, kilogram, second (human scale)

Lecture 1

Andrei Sirenko, NJIT

19

How can we measure time ?

Lecture 1

Andrei Sirenko, NJIT

20

Meter, Second, Kilogram

Meter - distance traveled by light (in vacuum)
during the time of 1/299 792 458 second

Second - time taken 9 192 631 770 oscillations
of the light (of a specific wavelength)
emitted by a cesium-133 atom; (atomic clock).

Kilogram - mass of a platinum-iridium
cylinder. US kilogram standard
is at NIST
1/12 Carbon atom = $1.6605402 \cdot 10^{-27}$ kg

<http://www.nist.gov>

The Standard Kilogram

Lecture 1

Andrei Sirenko, NJIT

21

1792

Lecture 1

Systems of Units

1 meter = $|XY|/10,000,000$

English

foot, slug (not pound!), second
We will use SI units in this course, but
it is useful to know conversions
between systems for making
estimates from your everyday
knowledge.

Andrei Sirenko, NJIT

22

French Revolution Calendar

1793 -1806

abolished on the 1st of January
1806 by Emperor Napoleon

12 months, no weeks but decades

New Year's Day at
autumnal equinox:

1st Vendémiaire =
22nd of September

- | | |
|----------------|---------------|
| 1. Vendémiaire | 7. Germinal |
| 2. Brumaire | 8. Floréal |
| 3. Frimaire | 9. Prairial |
| 4. Nivôse | 10. Messidor |
| 5. Pluviôse | 11. Thermidor |
| 6. Ventôse | 12. Fructidor |

1503-1566

Lecture 1

Andrei Sirenko, NJIT

23

Other Systems of Units:

English: foot, slug (not pound!), second

0.0254 m = 1 inch English System of Units

1 meter = 39.37 inches in the United States
(0.02540005 m)
(survey foot)

0.0246 m = 1 Prussian inch

1 mile = 1609 meters; The nautical mile is 1852 meters

Lecture 1

Andrei Sirenko, NJIT

24

Funny units of Length:

- “it is 2 hours North from here”
- “water is three handkerchiefs to the sunrise across this desert valley”
- “four light years from our planet”

Lecture 1

Andrei Sirenko, NJIT

SI Units (serious ones)

Length	meter	m
Mass	kilogram	kg
Time	second	s
Electric current	ampere	A
Thermodynamic temperature	kelvin	K
Luminous intensity	candela	cd
Amount of substance	mole	mol

Lecture 1

Andrei Sirenko, NJIT

26

TABLE 1-3 Some Approximate Lengths

Measurement	Length in Meters
Distance to the first galaxies formed	2×10^{26}
Distance to the Andromeda galaxy	2×10^{22}
Distance to the nearest star (Proxima Centauri)	4×10^{16}
Distance to Pluto	6×10^{12}
Radius of Earth	6×10^6
Height of Mt. Everest	9×10^3
Thickness of this page	1×10^{-4}
Length of a typical virus	1×10^{-8}
Radius of a hydrogen atom	5×10^{-11}
Radius of a proton	1×10^{-15}

TABLE 1-4 Some Approximate Time Intervals

Measurement	Time Interval in Seconds
Lifetime of the proton (predicted)	1×10^{39}
Age of the universe	5×10^{17}
Age of the pyramid of Cheops	1×10^{11}
Human life expectancy	2×10^9
Length of a day	9×10^4
Time between human heartbeats	8×10^{-1}
Lifetime of the muon	2×10^{-6}
Shortest lab light pulse	6×10^{-15}
Lifetime of the most unstable particle	1×10^{-23}
The Planck time ^a	1×10^{-43}

^a This is the earliest time after the big bang at which the laws of physics as we know them can be applied.

Meter, Second, Kilogram

TABLE 1-5 Some Approximate Masses

Object	Mass in Kilograms
Known universe	1×10^{53}
Our galaxy	2×10^{41}
Sun	2×10^{30}
Moon	7×10^{22}
Asteroid Eros	5×10^{15}
Small mountain	1×10^{12}
Ocean liner	7×10^7
Elephant	5×10^3
Grape	3×10^{-3}
Speck of dust	7×10^{-10}
Penicillin molecule	5×10^{-17}
Uranium atom	4×10^{-25}
Proton	2×10^{-27}
Electron	9×10^{-31}

27

The value of a physical quantity

is the quantitative expression of a particular physical quantity as the product of a number and a unit, the number being its numerical value. Thus, the numerical value of a particular physical quantity depends on the unit in which it is expressed.

For example, the value of the height h_W of the Washington Monument is $h_W = 169 \text{ m} = 555 \text{ ft}$. Here h_W is the **physical quantity**, its value expressed in the unit "**meter**," unit symbol m, is 169 m, and its numerical value when expressed in meters is 169. However, the value of h_W expressed in the unit "**foot**," symbol ft, is 555 ft, and its numerical value when expressed in feet is 555.

Lecture 1

Andrei Sirenko, NJIT

28

Why should we care about SI units?

November 10, 1999 MCO Failure Board Releases Report

Wide-ranging managerial and technical actions are underway at NASA's Jet Propulsion Laboratory, Pasadena, CA, in response to the loss of the Mars Climate Orbiter and the initial findings of the mission failure investigation board. [Full Story](#)

**SEPTEMBER 30, 1999
Likely Cause Of Orbiter Loss Found**
The peer review preliminary findings indicate that one team used English units (e.g., inches, feet and pounds) while the other used metric units for a key spacecraft operation. [Full Story](#)

<http://mars.jpl.nasa.gov/msp98/orbiter>

Lecture 1

Andrei Sirenko, NJIT

29

Prefixes for SI Units

10^x	Prefix	Symbol	
x=18	exa	E	
15	peta	P	
12	tera	T	
9	giga	G	GPascal
6	mega	M	MVOLT
3	kilo	k	kWatt
2	hecto	h	
1	deca	da	

Lecture 1

Andrei Sirenko, NJIT

30

Prefixes for SI Units

10^x	Prefix	Symbol	
x = -1	deci	d	
-2	centi	c	cm
-3	milli	m	mm
-6	micro	μ	μA
-9	nano	n	nm
-12	pico	p	pm
-15	femto	f	fm
-18	atto	a	

Lecture 1

Andrei Sirenko, NJIT

31

Useful conversions:

1 inch = 0.0254 meters (exactly)

1 meter = 39.37 inches

1 foot = 1200/3937 meter (1959).

(ft - international foot)

1 kg corresponds to ~2.2 lbs. weight

1 lb. weight corresponds to

about 0.454 kg

(this is called an 'improper conversion')

<http://physics.nist.gov/Pubs/SP811/appenB.html>

Lecture 1

Andrei Sirenko, NJIT

32

Unit Conversions

Multiply quantities and units:

$$60 \frac{\cancel{\text{min}}}{\cancel{\text{hr}}} \cdot 5280 \frac{\cancel{\text{ft}}}{\cancel{\text{mi}}} \cdot 12 \frac{\cancel{\text{in}}}{\cancel{\text{ft}}} \cdot 0.0254 \frac{\text{m}}{\cancel{\text{in}}} \cdot \frac{1}{3600} \frac{\cancel{\text{hr}}}{\text{s}}$$

$$26.8 \frac{\text{m}}{\text{s}}$$

Dimensional Analysis

Basic Quantities

Length [L]

Time [T]

Mass [M]

Derived Quantities

Velocity [L]/[T]

Acceleration [L]/[T]²

Density [M]/[L]³

Energy [M][L]²/[T]²

Precision

- Measurements
 - Uncertainties
 - Absolute
 - Percent
 - Calculation
 - Result can not be better than input data
 - Use scientific notation to show significant figures
 - Examples
 - 3.14 micron + 0.5 micron = 3.6 micron (physics)
 - 3.14 micron + 0.50 micron = 3.64 micron (physics)
 - 123,400,000 km = 1.234 × 10⁸ km
 - 0.003 m = 3 × 10⁻³ m

QZ1

print your name, ID#, Section #

What is the volume of the book in **cm³**.

(hint: 1 inch = 2.54 cm)
